

# Teaching Mineral Resources with an Emphasis on the NGSS Practices & Crosscutting Concepts

Aida Awad, Maine East High School, NAGT Past President

Ed Robeck, American Geosciences Institute, Director Center for Geoscience & Society

Alex Speer, Executive Director, Mineralogical Society of America

Susan Sullivan, Coop. Inst. for Research in Enviro. Sciences, NAGT Past President

# learning goals of this workshop:

- I can adapt InTeGrate module materials to align with NGSS crosscutting concepts, practices and DCIs.
- I can explain how and why managing mineral resources is a global challenge that depends both on geological (mineral forming) processes and non-geological factors with various impacts on the environment and communities.

# InTeGrate website:

## Summary

Despite humans' heavy reliance on Earth's mineral resources, few think about where the products they use come from and what it took to produce them. This module addresses that disconnect by combining learning about rocks and minerals (and how these become the products students use), methods of mineral resource discovery and extraction, and the impact of mineral resource use. This module allows important geoscience concepts to be taught in the context of important and immediate societal issues while also asking students to confront human issues such as environmental justice, economics, personal choice, and politics that may arise due to obtaining, beneficiating, transporting, trading, using, and disposing of natural resources.

## Strengths of the Module

Incorporates systems thinking inherent to the study of the rock cycle. It expands beyond the geosphere to include parts of the hydrosphere and atmosphere and how they are affected by mining.

Uses real-life examples of issues related to resource management and extraction for collaborative problem solving. These problems incorporate ideas from economics, social and environmental justice, and the geosciences.

Content is delivered using a variety of student-centered activities, including group discussions, [concept mapping](#), [iiasaws](#), and [cooperative learning](#).

Several student activities are hands-on, developing skills including analysis of actual geoscience data, model-building, and hypothesis formation and testing.

The module is extremely flexible, allowing for reorganization of units and even picking and choosing only select activities and/or units.

A great fit for courses in:

economic geology	geological hazards
environmental science	global change
environmental geology	sustainability
introductory geology

# Mineralogical Society of America resources:

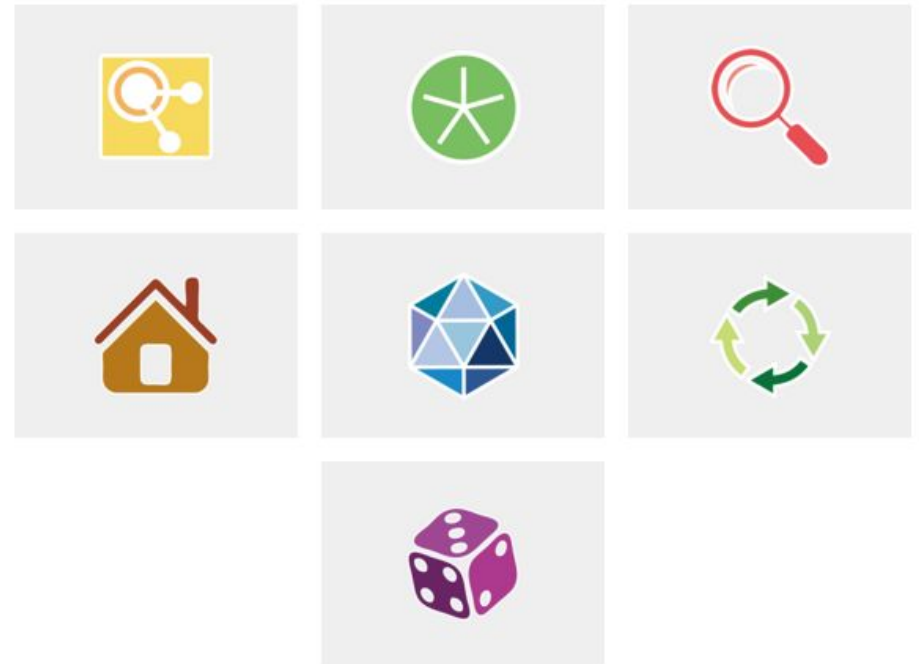

Welcome to MSA's Rockin' Internet Site

## [Mineralogy 4 Kids](#)

Mineralogy 4 Kids is the educational outreach website for the Mineralogical Society of America (MSA). This interactive website is designed to help children of all ages learn about mineral groups, properties, and identification. Visitors to the site can also learn about the rock cycle, crystals, and minerals used in homes. Additional resources are also listed.

## [Mineral Identification: MSA Mineral Collector's Corner](#)

The Mineralogical Society of America provides an online Mineral Identification Key to help users recognize the attributes of many kinds of minerals. The site gives information about mineral properties, environments, and associations. The Mineral Identification Key website is primarily focused on the needs of collectors, including a description of how basic mineral identification kits can be assembled.

## Concept mapping a resource

### Making learning visible: Concept mapping a resource

Sign up for one of the following commodities

tin	platinum-group metals	gypsum
tin	tantalum	bauxite
tin	tungsten	silica
tin	zinc	REEs
chromite	iron	chromite
chromite	nickel	sulfur
copper	nickel	phosphite
halite	cobalt	industrial diamonds
hydrobrom	lead	zinc
nickel	cadmium	

Note: Some of the commodities in the list above are mineral resources (rocks and minerals), whereas others are elements extracted from mineral resources.

- Use what you have learned about mineral resources as well as information about your specific commodity to draw a concept map showing:
- The geologic nature of the resource, for example, what is the mineral resource and the resultant commodity (mineral, rock, or element), what mineral and rock forming processes acted to create the commodity, in what geologic/geographic settings might these processes have occurred?
  - Physical characteristics of the resource.
  - The factors and people (people could be countries, companies, etc.) who determine the demand for the resource, for example, what is the commodity used for, why are it, and what other things might influence the demand for this resource?
  - The methods of mining and processing the commodity, for example, how and where does mining and processing occur, what environmental impacts occur, who is impacted by the overall mineral recovery process and in what ways?

Ideally, you should start this as soon as possible, filling in as much as you already know. Throughout this module, add to your concept map as you learn more about the commodity you choose and about mineral resources in general. You will use materials that you are learning in class, but you will also need to do extra research and look outside of the class.

Resources that may be helpful in addition to class may include your textbook, the USGS Minerals Yearbook website (<http://minerals.usgs.gov/minerals/yearbook/>), the Mineral Information Institute website (<http://www.mii.org/eng/eng.asp>) as well as other websites. When you turn in the assignment, please include a list of the sources (with web addresses as appropriate) that you used to complete your concept map, although you do not have to denote which information you obtained from each source.

## People, products & minerals

### Human's Dependence on Earth's Mineral Resources

#### Unit 1

#### People, Products, and Minerals

#### Post-class homework

- Learning objectives**
- infer the relationships between sustainability, resource availability, population growth, and economic development.
  - Extrapolate the impacts of growing populations and economic development on mineral resource extraction and use.

#### Population, economic development, and mineral resource use

In 1900, an estimated 1.65 billion people lived on Earth. Today, the population is more than 7 billion and still growing. By 2100, it is believed that an estimated 8-11 billion people will inhabit the Earth.

Every organism needs resources to provide food, water, shelter, and a location for waste disposal/processing. These resources are provided by the environment, which may include other organisms. Humans are unique in that we utilize so much of the planet for resource extraction and waste disposal to meet our needs and our desires. Our ability to appropriate and act has enabled many of us in the developed world to enjoy a high standard of living, including resources such as "stuff" and consuming beyond our basic needs. For example, in 2007, the United States used 15% of extracted mineral resources but is only home to 3% of the world's population (Gleeson and Krausmann, 2011).

— Watch the TED talk "Global Population Growth, Bee by Bee" given by Hans Rosling (approximately 10 minutes) at: [http://www.ted.com/talks/hans\\_rosling\\_on\\_global\\_population\\_growth.html](http://www.ted.com/talks/hans_rosling_on_global_population_growth.html) There is an "Interactive Transcript" in the bottom right corner of the video if you want to read along. It might be helpful to read through the questions below before you watch the video.

- Write down 10 items that you own that you feel you use as one modern U.S. society but that are excess or truly basic survival needs (such as food, water, shelter, etc.)
- Circle any of the items on the list above (#1) that you think are likely to be caused by someone in an impoverished country.

<https://goo.gl/44FR9p>

## Minerals & Products

### Human's Dependence on Earth's Mineral Resources

#### People, Products, and Minerals

#### Part I: Minerals and Products

Here is a list of the minerals, and their chemical formulas, that we have in class today. Use this, and other properties of the minerals (such as hardness, color, etc.), to match them to the products listed on the back of this sheet (one mineral per product).

Mineral Name	Chemical Formula
Apatite	Ca <sub>5</sub> (PO <sub>4</sub> ) <sub>3</sub> (F,Cl,OH)
Bauxite	Al(OH) <sub>3</sub> · AlO · OH
Barite	BaSO <sub>4</sub>
Calcite	CaCO <sub>3</sub>
Chalcocite	Cu <sub>2</sub> FeS <sub>2</sub>
Galena	PbS
Gypsum	CaSO <sub>4</sub>
Graphite	C
Gypsum	CaSO <sub>4</sub> · 2(H <sub>2</sub> O)
Halite	NaCl
Hematite (red)	Fe <sub>2</sub> O <sub>3</sub>
Hematite (specularite)	Fe <sub>2</sub> O <sub>3</sub>
Kaolinite	Al <sub>2</sub> Si <sub>2</sub> O <sub>5</sub> (OH) <sub>4</sub>
Muscovite	KAl <sub>3</sub> (AlSi <sub>3</sub> ) <sub>7</sub> O <sub>20</sub> (OH,F) <sub>4</sub>
Quartz	SiO <sub>2</sub>
Talc	Mg <sub>3</sub> Si <sub>4</sub> O <sub>10</sub> (OH) <sub>2</sub>

<https://goo.gl/Hbj24R>

## Economic development & resource use

### People, Products, and Minerals

#### Unit 1/Activity 3

#### Economic Development and Resource Use

#### Learning Outcomes

- infer the relationships between sustainability, resource availability, population growth, and economic development

#### Economic Development and Resource Use

The gross domestic product (GDP) of a country is frequently used as an indicator of a country's economic performance and its level of development. A per capita GDP is the overall GDP divided by the number of people in that country and can be used to more easily compare the economic performance of countries with different population sizes.

**Figure 1.1** The relationship between gross domestic product (GDP) per capita and the total domestic consumption use of industrial minerals in 2000 and conversion mineral in use per capita for 124 different countries in the year 2000 (Sourced from USSEP Development Unit 2011; Consumption (metric tons) data from Rosenberg et al., 2000; GDP data from <http://data.worldbank.org/indicator/SD.GY.CD.CD?locations=US>). Country codes are as follows: <http://www.iso.org/iso/home/standards/infrastructure/abbreviations.htm> with the exception of countries listed in part 1 of Table A.10.10. Note that the countries are labeled based on the space reserved

<https://goo.gl/vLwoiH>

## Rechargeable batteries & mineral resource use

### Part 1A. Changing technology: cell phone batteries

In this part, we'll look specifically at batteries themselves. Use the graph below, which shows the number of cell phone batteries purchased annually in the United States, to answer questions 1–3.

- Summarize in what ways the number of cell phone batteries has changed since 1996. You can write different answers for the different types of batteries.
- Why do you think that the number of batteries used has changed?

<https://goo.gl/15y8VS>

## Rare earth elements

### Rare Earth Elements: Supply, demand, consumption, price

Rare Earth Elements (REE) are extensively used every day in batteries, electronics, ceramics, and high-powered magnets, and they are vital for clean energy technologies as well. In this activity, we will look at REE supply, and consumption and price data, and discuss possible future strategies for balancing REE supply and demand.

China supplies the majority of the world's REE. The Chinese government sets the maximum amount of REE that can be legally exported out of the country (i.e., export quota) each year. The following table shows the amount of the export quota for the years 2000–2010 (except for 2002, for which we have no data), and the price per ton of REE adjusted for inflation with respect to the value of U.S. dollars (US\$) during 1993 (shown as 93\$, which means 1993 dollars per ton).

Year	Total export quota (metric tons)	REE price per ton** in USD during 1998, expressed as (98\$)
2000	47,000	6,110
2001	45,000	5,330
2002	N/A	6,800
2003	40,000	5,450
2004	45,000	7,410
2005	65,580	5,500
2006	61,070	3,150
2007	59,643	4,160
2008	49,990	10,300
2009	48,155	7,100
2010	30,258	14,500

\* Quota data from "China's Rare-Earth Production, Consumption, and Export Quotas for 2000 through 2011" (Lin, Pan, Klein, 2011; China's Rare-Earth Industry: U.S. Geological Survey Open-File Report 2011-102; 11 p.) Data from 2000 onward show total export quotas for domestic producers and traders, plus Sino-foreign joint ventures.

<https://goo.gl/5bh78j>

## Ore grades, waste, and remediation

### Human's Dependence on Earth's Mineral Resources

#### Unit 3

#### Mining and Mining Impacts

#### Part II: Ore Grades, Waste, and Remediation

#### Section I: Mining and Waste

Golden State's Big Mine (GSM), near Whitehall, Montana, opened in 1963 and is still open today. It is one of the properties owned by the Canadian company Barrick Gold Corp. Take a look at the attached satellite image of Golden State's Big Mine. Some remediation (slope stabilization) has been done by planting and growing vegetation on the west side of the West Waste Rock Dump Complex and on the northeast side of the East Waste Rock Dump Complex.

- On the attached satellite image, use a marker to denote the boundaries of mining areas (e.g., draw a line around the Mazon Hill Open Pit Mine area, etc.) and a different color marker to denote the boundaries of waste areas (e.g., draw a line around the West Waste Rock Dump Complex, etc.).
- Use the boundaries you created to estimate the approximate percentage of land surface area that is used for actual pit mining as opposed to the storage of mining waste products (including both waste rock and tailings). The approximate percentage of land surface used for pit mining as compared to that used in mine waste storage is:
  - 90–100%
  - 70–85%
  - 45–55%
  - 15–30%
- For a sense of scale:
  - Estimate the number of acres inside Tailings Impoundment #2 using the scale box (100 acres) on the map.
  - If an American football field, including the end zones, is about 1.32 acres, approximately (mathematically) how many football fields would fit inside Tailings Impoundment #2? Show your calculations here.
- Why might Tailings Impoundment #1 look different than Tailings Impoundment #2?
